Extension to conditional SMC

Suzie Brown

May 9, 2018

We now consider extending the results of Koskela et al. (2018) to the case of conditional SMC. In particular, the SMC updates will be conditioned on a particular trajectory surviving. We concentrate on the exchangeable model, so we may take WLOG that the "immortal line" is the trajectory containing individual 1 from each generation. We first assume the simplest case, with multinomial resampling; analogous to the standard SMC case where

$$v_t^{(i)} \overset{d}{=} \mathrm{Bin}(N, w_t^{(i)}), \qquad i = 1, \dots, N$$

yielding the coalescence rate

$$c_N(t) := \frac{1}{(N)_2} \sum_{i=1}^{N} \mathbb{E}\left[(v_t^{(i)})_2\right] = \sum_{i=1}^{N} \mathbb{E}\left[(w_t^{(i)})^2\right]. \tag{1}$$

But now, since the first line is immortal, in each time step the first individual must have at least one offspring. The remaining $N-1$ offspring are assigned multinomially to the N possible parents as usual, giving the offspring numbers:

$$\begin{aligned}
\tilde{v}_t^{(1)} &\overset{d}{=} 1 + \mathrm{Bin}(N-1, w_t^{(1)}) \\
\tilde{v}_t^{(i)} &\overset{d}{=} \mathrm{Bin}(N-1, w_t^{(i)}), \qquad i = 2, \dots, N.
\end{aligned}$$

We therefore have the following moments (using tower property):

$$\begin{aligned}
&\mathbb{E}[\tilde{v}_t^{(i)}] = (N-1)\mathbb{E}[w_t^{(i)}] \\
&\mathbb{E}[(\tilde{v}_t^{(i)})^2] = (N-1)(N-2)\mathbb{E}[(w_t^{(i)})^2] + (N-1)\mathbb{E}[w_t^{(i)}] \qquad\qquad i = 2, \dots, N \\
&\mathbb{E}[\tilde{v}_t^{(1)}] = (N-1)\mathbb{E}[w_t^{(1)}] + 1 \\
&\mathbb{E}[(\tilde{v}_t^{(1)})^2] = (N-1)(N-2)\mathbb{E}[(w_t^{(i)})^2] + 3(N-1)\mathbb{E}[w_t^{(1)}] + 1
\end{aligned}$$

and we can derive the altered coalescence rate:

$$\begin{aligned}
\tilde{c}_N(t) &= \frac{1}{(N)_2} \sum_{i=1}^{N} \mathbb{E}\left[(\tilde{v}_t^{(i)})_2\right] \\
&= \frac{1}{(N)_2} \mathbb{E}\left[(\tilde{v}_t^{(1)})^2 - \tilde{v}_t^{(1)}\right] + \frac{1}{(N)_2} \sum_{i=2}^{N} \mathbb{E}\left[(\tilde{v}_t^{(i)})^2 - \tilde{v}_t^{(i)}\right] \\
&= \frac{1}{(N)_2} \left[(N-1)(N-2)\mathbb{E}[(w_t^{(1)})^2] + 2(N-1)\mathbb{E}[w_t^{(1)}]\right] + \frac{1}{(N)_2} \sum_{i=2}^{N} (N-1)(N-2)\mathbb{E}[(w_t^{(i)})^2] \\
&= \frac{1}{(N)_2} \sum_{i=1}^{N} (N-1)(N-2)\mathbb{E}[(w_t^{(i)})^2] + \frac{1}{(N)_2} 2(N-1)\mathbb{E}[w_t^{(1)}] \\
&= \frac{N-2}{N} c_N(t) + \frac{2}{N}\mathbb{E}[w_t^{(1)}]
\end{aligned} \tag{2}$$

Since $w_t^{(1)} \leq 1$ for all t, as $N \to \infty$ we have

$$\tilde{c}_N(t) - c_N(t) = O(N^{-1})$$
